Formlabs has recently announced a new 3D printer, a desktop 3D printer called the Form 1. The device resembles a traditional laser engraver for 3D models and its purpose is to allow users to print physical objects in the same way they do with digital files. In addition to this, the Formlabs Form 1 only takes 2 hours to print a good-sized object, and even less time if you have a professional filament. Also, the Formlabs Form 1 is working with an open-source code called 'RepRap'. This code works like this: Once you know how to operate the printer's electronic components and software, anyone can operate it without spending too much money. This is the main reason why you should keep in mind that the Formlabs Form 1 is not a consumer-level device. Though it's not cheap, the Formlabs Form 1 is in a more affordable range than its competitors. But how does the Formlabs Form 1 stand out from other printers? Well, it comes with an Enclosed Design package for its main features, which makes it a unique device. These features include: 120V/240V AC or DC power source The printer comes with software, 3D printer Cartridge, and a spool of filament which is included Support for Digital scan which makes the print to start directly Prints in high resolution of up to 1200 dpi Prints in many printing formats, such as STL, Gcode, and JPG, and PDF as well It comes with a 700-pixel resolution control panel which is enough for a novice to use it Creates high precision resin prints or casts in minutes at a resolution of 0.1mm It comes with a 16.7-inch HD touch screen, WiFi, Bluetooth, and a fingerprint scanner for easy use It comes with a built-in auto loader It can be used with a smartphone for remote printer control Automatic depth sensor ensures that objects aren't stacked on top of each other The Formlabs Form 1 is not alone in the desktop 3D printer market. There are many other brands offering similarly-priced printers. Although you may think that Formlabs Form 1's price is quite steep, the price can be considered as quite affordable for other 3D printers in the market. It doesn't have the specifications that some of the

For more information about this tool, see **Drawing Tools**. The Pen tool allows you to draw lines and freehand paths. The most common use of the Pen tool is to create shapes for textures and masks in an image. Pen tools are one of the five drawing tools that are built into Photoshop, but there are others, including the Magic Wand and the Lasso. The Pen tools are covered in Chapter 6. The Clone Stamp tool allows you to easily copy an area of pixels from one layer to another. For more information, see **Brushes** or **Drawing Tools**. Layers **Layers** are one of the basic tools you use in Photoshop. They allow you to create and manage separate parts of an image. Layers can be combined and overlapped to create several individual images. You can also combine several layers with the Dodge and Burn tools. In an image that has layers, the bottom layer is the original image. The top layer is the layer that has been composed. **# Comparing layers, pixels, and layers** The original image can also be called a **raster image**, as it is just a collection of pixels arranged in rows and columns. An RGB image is a raster image, and the raster format is used in many other image-editing programs such as Corel Draw and Fireworks. A layer is the **underlying image** that contains all the pixels that form an object in an image. The layer used to create a layer mask or transparency channel is called a **background layer**. All the other layers in an image stack on top of the background layer. The pixels in the background layer cannot be seen, but you can change the opacity of the other layers by changing the opacity of the background layer. Pixels are the individual spots that make up the image. A pixel is either transparent or opaque. However, an image file is always a **combined image** that contains many layers. **# Note** A layer mask cannot be placed on a pixels layer. A layer mask can be placed on a background layer or any other layer in the image. **# When layers and pixels refer to the same object** When layers and pixels refer to the same object, the pixels of the object are **located** on **top** of the
