Field of the Invention The present invention relates to a method for manufacturing a semiconductor device that employs a metal wiring, and a semiconductor device. 2. Description of the Related Art In recent years, a highly integrated semiconductor device requires higher-speed operation and lower electric power. The above semiconductor device has a basic structure formed by a semiconductor substrate, gate insulating film, impurity diffusing region, a gate electrode, an insulating film, and a metal wiring. The miniaturization of the metal wiring causes the following problems. Firstly, in the case where the metal wiring is formed by sputtering, and metal is deposited, the following problem may occur. Since the surface of the metal layer is very smooth, the adhesion strength between the metal layer and the insulating film covering the metal layer is insufficient. Secondly, when the metal wiring is formed by a chemical vapor deposition (CVD), the adhesion strength between the metal layer and the insulating film is low. To solve this problem, an insulating film having a good adhesion with the metal layer is
